

Solution to Exercise 1: A relational database and “Aggregating” vs from “long-to-wide”

Key points:

- A relational database is the solution to a varying number of observations per individual
- The child file is merged with the parent file to give a dataset of all observations
- To obtain means for an individual from continuous variables, aggregating the data is the strategy of choice
- To reduce the dataset to individuals with information on each examination, one must copy the information from observations in the vertical to newly created fields in the first observation of each individual before selecting that record from the individual (“long-to-wide”)

Task

- **Prepare a data documentation sheet**

The documentation sheet is shown on the next page.

Task

- **Prepare the EpiData Manager form for the relational database**

The data entry forms may be made as follows:

D_EX01_PATIENT.EPX	D_EX01_VISIT.EPX
<p style="text-align: center;">Entry form for the patient</p> <p>Unique patient identifier <input type="text"/></p> <p>Patient's sex <input type="text"/> label_sex</p> <p>Marital status <input type="text"/> label_marital</p>	<p style="text-align: center;">Entry form for the visit</p> <p>Unique patient identifier <input type="text"/></p> <p>Unique visit identifier <input type="text"/></p> <p>Date of visit <input type="text"/></p> <p>Plasma glucose in mMol/L <input type="text"/></p> <p>Quality aspect of sputum <input type="text"/> label_sputum</p> <p>Microscopy result <input type="text"/> label_micres</p>

The data documentation sheet:

Data documentation sheet

Field name	Field label	Field type	Field length	Field values	Value label	Field comment
Patient file	idpat	Unique patient identifier	U	1	A,...,Z	Any given unique ID
	sex	Patient's sex	I	1	1 Female 2 Male 3 Unknown	
	marital	Patient's marital status	I	1	1 Single 2 Married 3 Cohabiting 4 Annulled 5 Divorced 6 Widowed 7 Separated 8 Engaged 9 Not recorded	

NOTE: If SEX is given during an earlier examination and left empty in a subsequent examination, update the information to known

If SEX is different in different examinations, record as UNKNOWN

If MARITAL is given during an earlier examination and left empty in a subsequent examination, keep the initial information from earlier

If MARITAL is different in different examinations, update to most recent information

Examination file	idvisit	Unique examination identifier	S	12	A-2007-01-31,...	Automatically calculated
	visitdate	Date of visit	dd/mm/yyyy	10	01/01/2007,...,31/12/2007 01/01/1800	Legal visit date recordings Enter if visit date is missing
	bs	Fasting plasma blood glucose (mMol)	F	4	2.5,...,19.9 99.9	Legal valid value Enter if blood sugar is missing
	sputum	Macroscopic sputum aspect	I	1	1 Mucoid 2 Purulent	

micres

Microscopy result

I

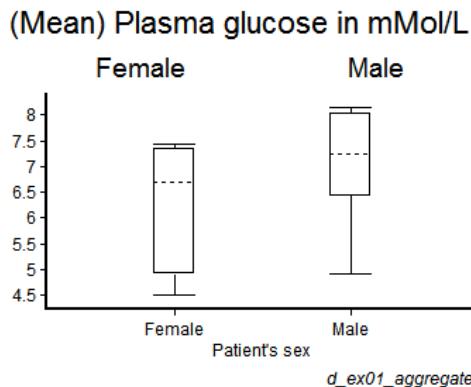

1

- 3 Muco-purulent
- 4 Blood-tinged
- 5 Salivary
- 9 Not recorded
- 0 Negative
- 1 "1+ positive"
- 2 "2+ positive"
- 3 "3+ positive"
- 4 "Scanty positive"
- 9 "Not recorded"

Task:

- Write a program D_EX01.PGM that merges the two files, then prepare sets for the aggregated data and for the “long-to-wide” transformation to produce the following output respectively:

From aggregating the data:

From transformation “long-to-wide”:

"Table 1. Pattern of serial smear results"

	Definition of case by microscopy		
	of 4 serial smears	Negative	Positive
	Total		
N---	2	0	2
NN--	1	0	1
NP9P	0	1	1
NPP-	0	3	3
PNP-	0	1	1
PP--	0	2	2
Total	3	7	10

"Table 2. Incremental yield among positive results"

	Patient's sex			%
	Incremental yield of first 3 smears	% Female	% Male	
NPx	2 {66.7}	2 {50.0}	4 {57.1}	
Px	1 {33.3}	2 {50.0}	3 {42.9}	
Total	3 {100.0}	4 {100.0}	7	
Percents: {Col}				

The D_EX01.PGM reads:

```

* Part D, Exercise 1
* Merging files and aggregating files
* Copying and transposing data from "Long-to-wide"

* Written by:      Hans L Rieder
* First version: 17 Jan 2010
* Last revision: 11 Nov 2016
